Design

A thick, light gray horizontal bar is positioned below the word "Design", extending across most of the width of the page.

Lift-Bit

Lift-Bit is a modular, digitally-reconfigurable furniture system that allows a sofa to seamlessly turn into a chair, a chaise longue, a bed, a lounge room, and myriad of other configurations. The system is composed of a series of individual, upholstered stools. Each element is motorized using a linear actuator, enabling it to be raised or lowered

Lift-Bit can be controlled in person, via a simple gesture (just hovering your hand in the air over the seat), or from a distance, through the use of a mobile app. The app includes both a series of predetermined three-dimensional shapes and a tool to create new, dynamic combinations. The Lift-Bit system can even become 'bored': when not used for a long time, it will start shape-shifting on its own to engage users.

Arriving

Determine suitable
arrangement

Leaving

Determine availability

Arriving - Goal and Indicator

Goal

Automatically decide
optimal vertical
arrangement

CV Indicator

Group or individual

Fallback

Manual override
of decision

Arriving - Reference

Arriving - Challenges & Feedback

- What if one person joins later?
 - Privacy concerns

Model feedback

Manual overrides

Leaving - Goal and Indicator

Goal

Reset spaces that
are no longer occupied

CV Indicator

Empty chair and table

Fallback

Feedback to user
that furniture is
about to reset
with manual
override

Leaving - Reference

Source: https://www.researchgate.net/figure/In-PKLot-only-some-of-the-cars-spaces-are-annotated_fig1_334775942

Leaving - Challenges

- Different lighting scenarios throughout the day
- Flexible configuration and height, has to detect location of tables
 - Objects of the same color as table
 - Something might obstruct view
